# ON THE DIOPHANTINE EQUATION 

$$
x^{p}-x=y^{q}-y
$$

M. Mignotte ${ }^{\dagger}$ and A. Реthő ${ }^{\ddagger}$

Abstract $\quad$ We consider the diophantine equation

$\quad x^{p}-x=y^{q}-y$ | in integers $(x, p, y, q)$. We prove that for given $p$ and $q$ with $2 \leq$ |
| :--- |
| $p<q(*)$ has only finitely many solutions. Assuming the abc- |
| conjecture we can prove that $p$ and $q$ are bounded. In the special |
| case $p=2$ and $y$ a prime power we are able to solve $(*)$ completely. |
