REGULARITY FOR ENTROPY SOLUTIONS OF PARABOLIC $p$-LAPLACIAN TYPE EQUATIONS

S. SEGURA DE LEÓN AND J. TOLEDO

Abstract

In this note we give some summability results for entropy solutions of the nonlinear parabolic equation $u_t - \text{div} a_p(x, \nabla u) = f$ in $]0, T[\times\Omega$ with initial datum in $L^1(\Omega)$ and assuming Dirichlet’s boundary condition, where $a_p(\cdot, \cdot)$ is a Carathéodory function satisfying the classical Leray-Lions hypotheses, $f \in L^1(]0, T[\times\Omega)$ and $\Omega$ is a domain in $\mathbb{R}^N$. We find spaces of type $L^r(0, T; \mathcal{M}^t(\Omega))$ containing the entropy solution and its gradient. We also include some summability results when $f = 0$ and the $p$-Laplacian equation is considered.
