Abstract

In this paper we present for the first time examples of algebraic limit cycles and saddle loops of degree greater than 4 for planar quadratic systems. In particular, we give examples of algebraic limit cycles of degree 5 and 6, and algebraic saddle loops of degree 3 and 5 surrounding a strong focus. We also give an example of an invariant algebraic curve of degree 12 for which the quadratic system has no Darboux integrating factors or first integrals.

1. Introduction

We shall study polynomial differential systems in \mathbb{R}^2 defined by

$$\dot{x} = p(x, y), \quad \dot{y} = q(x, y), \quad (1)$$
