## Abstract

We study the number of limit cycles bifurcating from a piecewise quadratic system. All the differential systems considered are piecewise in two zones separated by a straight line. We prove the existence of 16 crossing limit cycles in this class of systems. If we denote by  $H_p(n)$  the extension of the Hilbert number to degree  $n$  piecewise polynomial differential systems, then  $H_p(2) \geq 16$ . As far as we are concerned, this is the best lower bound for the quadratic class. Moreover, in the studied cases, all limit cycles appear nested bifurcating from a period annulus of a isochronous quadratic center.
