

VIRTUALLY REPELLING FIXED POINTS

XAVIER BUFF

Abstract

In this article, we study the notion of *virtually repelling fixed point*. We first give a definition and an interpretation of it. We then prove that most proper holomorphic mappings $f: U \rightarrow V$ with U contained in V have at least one virtually repelling fixed point.

2000 *Mathematics Subject Classification*. 37F99.

Key words. Fixed point, holomorphic index, rational-like mapping.
